15-125 HP @ 1750 RPM 7.5-40 HP @ 1150 RPM

IMPORTANT! - Read all instructions in this manual before operating or servicing a pump.

Before installation, read the following instructions carefully. Failure to follow instruction and safety information could cause serious bodily injury, death and/or property damage. Each Barmesa product is carefully inspected to insure proper performance. Closely following these instructions will eliminate potential operating problems, assuring years of trouble-free service.

**⚠ DANGER** "Danger" indicates an imminently hazardous situation which, if not avoided, WILL result in death or serious injury.

**△ WARNING "Warning" indicates** an imminenty hazardous situation which, if not avoided, MAY result in death or serious injury.

**△ CAUTION** "Caution" indicates a potentially hazardous situation which, if not avoided, MAY result in minor or moderate injury.

IMPORTANT! - Barmesa Pumps is not responsible for losses, injury or death resulting from failure to observe these safety precautions, misuse, abuse or misapplication of pumps or equipment.

ALL RETURNED PRODUCTS MUST BE CLEANED, SANITIZED, OR

**DECONTAMINATED PRIOR TO** SHIPMENT, TO INSURE **EMPLOYEES WILL NOT BE EXPOSED TO HEALTH HAZARDS IN** HANDLING SAID MATERIAL. ALL APPLICABLE LAWS AND REGULATIONS SHALL APPLY.

⚠ WARNING Installation, wiring, and iunction connections must be in accordance with the National Electric Code and all applicable state and local codes. Requirements may vary depending on usage and location.

**△ WARNING** Installation and servicing is to be conducted by qualified personnel only.

Keep clear of suction and discharge openings. Do not insert fingers in pump with

power connected; the rotating cutter and/or impeller can cause serious

Always wear eye protection when working on pumps. Do not wear loose clothing that

may become entangled in moving parts.

**△ DANGER** Pumps build up heat and pressure during operation. Allow time for pumps to cool

before handling or servicing the pump or any accessory items associated with or near the pump.

△ DANGER This pump is not intended for use in swimming pools or water installations where there is human contact with pumped fluid.

⚠ **DANGER** Risk of electric shock. To reduce risk of electric shock, always disconnect pump I from power source before

handling any aspect of the pumping system. Lock out power and tag.

**⚠ WARNING Do not** use these pumps in water over 104° F. **Do not** exceed manufacturers recommended maximum performance, as this could cause the motor to overheat.

**△ DANGER Do not** lift, carry or hang pump by the electrical cables. Damage to the electrical cables can cause

shock, burns or death. Never handle connected power cords with wet hands. Use appropriate lifting device.

△ WARNING Ground Fault Circuit Interrupter (GFCI) to be used with plug-in type power cord.

pumps often handle materials which could cause illness or disease. Wear adequate protective clothing when working on a used pump or piping. Never enter a basin after it has been used.

**△ DANGER** Failure to permanently ground the pump, motor and controls before connecting to power can cause shock, burns or death.

**△ DANGER** These pumps are not to be installed in locations المراجعة classified as hazardous in accordance with the National

Electric Code, ANSI/NFPA 70.

△ WARNING The Uniform Plumbing Code (UPC) states that sewage systems shall have an audio and visual alarm that signals a malfunction of the systems, that are required to reduce the potencial for property damage.

IMPORTANT! - Prior to installation. record Model Number, Serial, Amps, Voltage, Phase and HP from pump name plate for the future reference. Also record the Voltage and Current Readings at Startup:

3 Phase Models						
Amps L1-2:	Volts L1-2:					
Amps L2-3:	Volts L2-3:					
Amps L3-1: Volts L3-1:						

7111p3 L3 1.	VOICS ES 1.
Model Number:	
Serial:	-
PHASE: HP: _	

**DISCHARGE:** 4", 6" & 8"125lb, flange horizontal.

SPHERICAL SLD HNDLG: 3"

**LIQUID TEMPERATURE:** 104 °F (40 °C) max.

VOLUTE:Cast iron ASTM A-48 class 30MOTOR HOUSING:Cast iron ASTM A-48 class 30SEAL PLATE:Cast iron ASTM A-48 class 30

**IMPELLER:** Enclosed mono vane for 4SW and dual vane for 6SW and 8SW, with pump-out vanes

on back side. Dynamically balanced. Ductile iron ASTM A-536, 65-45-12.

**SHAFT:** 416 series stainless steel **HARDWARE:** 300 series stainless steel

O-RINGS: Buna-N

**LIFTING BAILS:** 300 series stainless steel

**MAX.SUBMERGENCE:** 66 ft (20 m) Epoxy

**MECHANICAL SEAL:** Double, tandem, in oil filled reservoir. Inboard rotating faces, carbon; stationary

faces, ceramic. Outboard rotating and stationary faces, silicon carbide. Buna-N

elastomer and 300 series stainless steel hardware.

**CORD ENTRY:** 40 ft cord, epoxy sealed housing, with secondary pressure grommet for sealing and

strain relief.

**UPPER BEARING:** Ball, single row, oil lubricated, for radial load.

**LOWER BEARING:** Ball, single row, oil lubricated, for radial and thrust loads.

MOTOR: NEMA three phase 208/230 & 460 V, premium efficiency, oil-filled, squirrel cage

induction, inverted duty rated. Class H insulation. Requires overload protection in

control panel.

**MOISTURE SENSOR:** Normally open (N/O), requires relay and panel.

**TEMPERATURE SENSOR:** Normally closed (N/C), to be wired in series with control circuit.

**OPTIONAL EQUIPMENT:** Slide rail coupling, leg kit and seal material.

### **▶** Receiving inspection

Upon receiving the pump, it should be inspected for damage or shortages. If damage has occurred, file a claim immediately with the company that delivered the pump. If the manual is removed from the packaging, do not lose or misplace.

### **▶** Storage

Any product that is stored for a period longer than six (6) months from the date of purchase should be bench tested prior to installation. A bench test consists of, checking the impeller to assure it is free turning and a run test to assure the motor (and switch if provided) operate properly.

### **▶** Controls

Manual models require a separate approved pump control device or panel for automatic operation. Be sure the electrical specification of the control selected properly match the electrical specifications of the pump.

### **▶** Submergence

The pump should always be operated in the submerged condition. The minimum sump liquid level should never be less than above the pump's volute (See Figure 1).

### **▶** Installation

These pumps are recommended for use in a sump, basin or lift station. The sump, basin or lift station shall be sealed and vented in accordance with local plumbing codes. This pump is designed to pump sewage, effluent or wastewater, non-explosive and non-corrosive liquids and shall NOT be installed in locations classified as hazardous in accordance with the National Electrical Code (NEC) ANSI/NFPA 70 or Canadian Electric Code (CEC). The pump should never be installed in a trench, ditch, or hole with a dirt bottom. The legs will sink into the dirt and the suction will become plugged.

The installation should be at a sufficient depth to ensure that all plumbing is below the frost line. If this is not feasible, remove the check valve and size the basin to accommodate the additional backflow volume.

Pumps are most commonly installed in simplex or duplex stations or basins with a slide rail system (Barmesa SRC), which allows the pump(s) to be installed or removed without requiring personnel to enter the station, or resting on the basin floor.

### **▶** Discharge Piping

Discharge piping should be as short as possible and sized no smaller than the pump discharge. Do not reduce the discharge pipe size below that which is provided on the pump. Both a check valve and a shut-off valve are recommended for each pump. The check valve is used to prevent backflow into the sump. The shut-off valve is used to manually stop system low during pump servicing.

### **▶ Liquid Level Controls**

The level control(s) should be mounted on the discharge piping, a cable rack or float pole. The level control should have adequate clearance so it cannot hang up in it's swing and that the pump is completely submerged when the level control is in the "Off" mode. By adjusting the cord tether the control level can be changed. One cycle of operation should be observed, so that any potential problems can be corrected.

It is recommended that the level control float should be set to insure that the liquid in the sump never drops below the top of the motor housing or a minimum level of 10 inches above the basin floor.

# ► Electrical Connections Power cable:

The power cable mounted to the pump must not be modified in any way except for shortening to a specific application. Any splice between the pump and the control panel must be made in accordance with the electric codes. It is recommended that a junction box, if used, be mounted outside the sump or be of at a minimum NEMA 4 construction if located within the wet well. **DO NOT USE THE POWER CABLETO LIFT PUMP.** 

Always rely upon a Certified Electrician for installation.

### **Overload Protection:**

**Single Phase** - The stator in-winding overload protector used is referred to as an inherent overheating protector and operates on the combined effect of temperature and current. This means that the overload protector will trip out and shut the pump off if the windings become too hot, or the load current passing through them becomes too high.

**IMPORTANT!** - The overload will then automatically reset and start the pump up after the motor cools to a safe temperature. In the event of an overload, the source of this condition should be determined and corrected immediately.

**MARNING DO NOT ALLOW THE** PUMP TO CYCLE OR RUN IF AN OVERLOAD CONDITION OCCURS.

Three Phase - The Normally Closed (N/C) thermal sensor is embedded in the motor windings and will detect excessive heat in the event an overload condition occurs. The thermal sensor will trip when the windings become too hot and will automatically reset when the pump motor cools to a safe temperature. It is recommended that the thermal sensor be connected in series to an alarm device to alert the operator of an overload condition, and/or the motor starter coil to stop the pump. In the event of an overload, the source of this condition should be determined and repaired.

# **△ WARNING DO NOT ALLOW THE** PUMP TO CYCLE OR RUN IF AN OVERLOAD CONDITION OCCURS.

Moisture Sensors - A normally open (N/O) sensor rated of 1 watt @330K ohms, 500 volt, is installed in the pump seal chamber which will detect moisture present. recommended that this detector be wired in series to an alarm device or motor starter coil to alert the operator that a moisture detect has occurred. In the event of a moisture detect, check the individual moisture sensor probe leads for continuity, (∞ resistance = no moisture) and the iunction box/control box for moisture content.

These situations may induce a false signal in the moisture detecting circuit. If none of the above test prove conclusive, the pump(s) should be pulled and the source of the failure repaired. IF A MOISTURE DETECT HAS **OCCURRED** MAINTENANCE SHOULD BE PERFORMED AS SOON AS POSSIBLE!

If current through the temperature sensor exceeds the values listed, an intermediate control circuit relav must be used to reduce the current or the sensor will not work properly.

TEMPERATURE SENSOR ELECTRICAL								
RATINGS								
Volts	Continuous	Inrush						
	Amperes	Amperes						
110-120	3.00	30.0						
220-240	1.50	15.0						
440-480	0.75	7.5						
600	0.60	6.0						

### Wire Size:

If longer power cable is required consult a qualified electrician for proper wire size.

### **▶** Pre-Operation

- 1. Check Voltage and Phase -Compare the voltage and phase information stamped on the pump name plate.
- 2. Check Pump Rotation Improper motor rotation can result in poor pump performance and can damage the motor and/or pump. Check rotation on three phase units by momentarily applying power and observe the "kickback".

Kickback should always be in a counter-clockwise direction as viewed from motor end or opposite to impeller rotation. Impeller rotation is counter-clockwise as viewed from bottom of pump.

- 3. Name Plate Record the information from the pump name plate to drawing in front of manual for future reference.
- 4. Insulation Test An insulation (megger) test should be performed on the motor. Before the pump is put into service. The resistance values (ohms) as well as the voltage (volts) and current (amps) should be recorded.
- 5. Pump-Down Test Be sure pump has been properly wired, lowered into the basin, sump or lift station, check the system by filling with liquid and allowing the pump to operate through its pumping cycle. The time needed to empty the system, or pump-down time along with the volume of water, should be recorded.

### **▶** Maintenance

No lubrication or maintenance is required. Perform the following checks when pump is removed from operation or when pump performance deteriorates:

- a) Inspect motor chamber for oil level and contamination.
- b) Inspect impeller and body for excessive build-up or clogging.
- c) Inspect motor, bearings and shaft seal for wear or leakage.

### ▶ Servicing

Cooling Oil - Anytime the pump is removed from operation, the cooling oil in the motor housing should be checked visually for oil level and contamination. To check oil, set unit upright. Remove cap screws, lift conduit box assembly from motor housing, Do Not disconnect wiring from motor leads. With a flashlight, visually inspect the oil in the motor housing to make sure it is clean and clear, light amber in color and free from suspended particles. Milky white oil indicates the presence of water. Oil level should be just above the motor when pump is in vertical position.

**Seal Chamber** - Drain oil from seal chamber by placing pump on its side and remove pipe plug. If the oil is found to contain considerable water or other contamination, the shaft seal should be inspected and replaced if required.

### **Oil Testina**

- Drain oil into a clean, dry container placing pump on it's side, remove cap screws, lift conduit box assembly from motor housing. In separate container drain seal chamber by removing plug.
- Check oil for contamination using an oil tester with a range to 30 kV breakdown.
- If oil is found to be clean and uncontaminated (measuring above 15 kV breakdown), refill the housing.

 If oil is found to be dirty or contaminated (or measures below 15 kV breakdown), the pump must be carefully inspected for leaks at the shaft seal, conduit box, o-rings, pipe plug and pressure valve, before refilling with oil.

After leak is repaired, dispose of old oil properly, and refill with new oil.

**Oil Replacement** - Set unit upright and refill with new cooling oil as per table. Fill to just above motor as an air space must remain in the top of the housing to compensate for oil expansion. Reassemble the o-ringand conduit box to motor housing. Apply thread locking compound to cap screws and place into holes and torque to 15 ft/lbs.

**DO NOT** overfill oil. Overfilling of housing with oil can create excessive and dangerous hydraulic pressure which can destroy the pump and create a hazard.

Overfilling oil voids warranty.

### Oil Replacement:

**Seal Chamber** - Refill chamber completely full with new cooling oil or reuse the uncontaminated oil.

Cooling Oil Recommended Supplier/Grade						
BP	Enerpar SE100					
Conoco	Pale Parafin 22					
Mobile	D.T.E. Oil Light					
Shell Canada	Transformer-10					
Texaco	Diala-Oil-AX					

### **▶** Disassembly

Impeller and Volute - Disconnect power. Remove hex nuts and vertically lift motor housing and seal plate assembly from volute. Clean out volute if necessary. Inspect gasket and replace if cut or damaged. Clean and examine impeller, for pitting or wear and replace if required. To remove impeller, remove cap screw and washer. With a wheel puller, pull impeller straight of shaft and remove square key.

Moisture Probes - Drain oil from seal chamber, if not already done. Remove cap screws and lifting handle. Set unit upside down on blocks to avoid damaging cables. Remove socket head cap screws and lift seal plate, with seal's stationary, vertically from bearing housing, do not damage seal. Check moisture sensor probes for damage, replace by removing screws and disconnecting wires. Then remove probes from bearing housing.

**Shaft Seal -** Remove outboard rotating member of seal, spring and inboard rotating member from shaft. Examine all seal parts.

Inspect seal for signs of uneven wear pattern on stationary members, chips and scratches on either seal face. **DO NOT interchange seal components, replace the entire shaft seal**. If replacing seal, remove stationary by prying out with flat screwdriver.

**Motor and Bearings** - Remove volute, impeller, seal plate and seal as previously stated and drain oil from motor housing. Position unit upright, using blocks to avoid resting unit on shaft. Remove cap screws o-ring and conduit box assembly from motor housing.

Note connections and then remove cable lead wires from motor lead wires and moisture and temperature sensor wires from control cable by removing connectors. Remove cap screws and vertically lift the motor housing from bearing housing. Replace square ring if damaged or cut. Remove the upper motor bolts and lift upper end bell from motor. Remove wave washer. Remove upper bearing with a wheel puller if damaged or worn.

Vertically lift stator from rotor/shaft. Inspect windings for shorts and resistance. Test the temperature sensors by checking for continuity between the black and white wires. If defective contact factory or motor service station. Pull motor rotor/shaft with bearing from bearing housing. Remove bearing with a wheel puller if worn or damaged. If rotor or stator windings are defective, replace the complete motor.

IMPORTANT! - All parts must be clean before reassembly.

# **▶** Reassembly

**Bearings** - Replace bearings, being careful not to damage the rotor or shaft. If equipped, fill notch should face the rotor core for both upper and lower bearings.

Apply adhesive compound to the shaft and press bearing onto shaft, position squarely onto the shaft applying force to the inner race of bearing only, until bearing seats on shoulder of the shaft. In the same manner, assemble upper bearing to shaft.

**Motor** - Slide rotor with bearing into bearing housing until bearing seats on the bottom. Position motor housing and stator into pilot, install wave washers in upper end bell.

IMPORTANT! Special wave washers in upper motor housing are required to compensate for shaft expansion. These washers must be properly reinstalled to give the required constant down force on the motor shaft.

Position upper motor end bell aligning holes and thread cap screws into bearing housing and torque to 16 ft/lbs. Place all motor leads above the motor. Position square ring on bearing housing and lower housing over motor and into pilot, aligning handle so that it is parallel to motor end bell reliefs. Apply thread locking compound to threads on cap screws and place into holes and torque to 24 ft/lbs.

Handle seal parts with extreme care. DO NOT damage lapped surfaces.

**Seal** - (See Figure 2) Clean and oil seal cavities in bearing housing and seal plate. Lightly oil (**Do not use grease**) outer surface of inboard and outboard stationary members of seal. Press inboard stationary member firmly into bearing housing and outboard stationary into seal plate, using a seal pusher tool. Nothing but the seal pusher tool is to come in contact with seal face.

IMPORTANT! - Hammering on the seal pusher tool will damage the seal face.

Be sure the stationary members are in straight and that the rubber ring is not out of it's groove. Lightly oil (**Do not use grease**) shaft and inner surface of bellows on rotating member. With lapped surface facing bearing housing, slide rotating member onto shaft using seal pusher tool, until lapped faces are together. It is extremely important to keep seal faces clean during assembly. Dirt particles lodged between faces will cause the seal to leak.

Be sure driving lugs in retainer are matched in rotating member of seal. Place spring over shaft and in place on rotating member, making sure it is seated in retainer and not cocked or resting on bellows tail. Lightly oil shaft and inner surface of outboard rotating member.

With tail section toward bearing housing, slide rotating member onto shaft with seal pusher tool until retainer engages spring and spring is compressed slightly.

Spring should be properly engaged in both retainers.

Place seal plate over shaft onto bearing housing, being careful not to damage outboard stationary member and align holes for cap screws.

Thread cap screws into bearing housing and tighten. Refill chamber with oil.

Conduit Box Assembly - Check power and control cables for cracks or damage and replace complete conduit box if required. (See Figure 3) Bring motor wires through opening in top of motor housing, check sleeving and replace if damaged. Position square ring in conduit box and reconnect leads using connectors and insulators. See wiring schematics.

Refill with cooling oil. Position conduit box with square ring on motor housing. Apply thread locking compound to cap screws threads and torque to 16 ft/lbs.

Remove gland nuts and, washers and, and grommets and from conduit box, inspect and replace if damaged (See Figure 3). Reassemble by inserting one washer, grommet, one more washer and gland nut into conduit box. Torque gland nuts to 15 ft/lbs to prevent leakage.

Impeller and Volute - Install impeller by applying a thin film of oil to motor shaft and slide impeller straight onto shaft, keeping keyways lined up. Drive key into keyway. Locate washer, apply thread lock primer (such as Loctite® Primer T), let set per manufacturer's directions. Apply thread locking compound to threads on cap screw, and thread into shaft and torque to 35 ft/lbs.

Place gasket on volute and install impeller and motor assembly over studs and onto volute. Apply thread locking compound to threads of studs and thread nuts onto studs and torque to 24 ft/lbs. Check for binding by rotating impeller. Clearance between the impeller and volute should be approximately 0.012 inch.

#### Risk of electric shock. Always disconnect the pump from the power source before handling inspections or repairs.

Symptom	Possible Cause(s)	Corrective Action
Pump will not run	1. Poor electrical connection, blown fuse, tripped breaker or other interruption of power; improper power supply 2. Motor or switch inoperative (go to manual operation) 2a. Float movement restricted 2b. Switch will not activate pump or is defective 2c. Defective motor 3. Insufficient liquid level	1. Check all electrical connections for security. Have electrician measure current in motor leads, if current is within ± 20% of locked rotor Amps, impeller is probably locked. If current is 0, overload may be tripped. Remove power, allow pump to cool, then re-check current.  2a. Reposition pump or clean basin as required to provide adaquate clearance for float  2b. Disconnect level control. Set ohmmeter for a
Pump will not turn off	<ul> <li>2a. Float movement restricted</li> <li>2b. Switch will not activate pump or is defective</li> <li>4. Excessive inflow or pump not properly sized for application</li> <li>9. Pump may be air locked causing pump not to flow</li> <li>14. H-O-A switch on panel is in "HAND" position</li> </ul>	low rang, such as 100 ohms full scale and connect to level control leads. Actuate level control manually and check to see that ohmmeter shows zero ohms for closed switch and full scale for open switch. (Float Switch)  2c. Check winding insulation (Megger Test) and winding resistance. If check is outside of range,
Pump hums but doesn't run	Incorrect low voltage     Impeller jammed or loose on shaft, or inlet plugged	dry and re-check. If still defective, replace per service instructions.  3. Make sure liquid level is above the pump
Pump delivers insufficient capacity	<ol> <li>Incorrect low voltage</li> <li>Excessive inflow or pump not properly sized for application</li> <li>Discharge restricted</li> <li>Check valve partially closed or installed backwards</li> <li>Shut-off valve closed</li> <li>Impeller jammed or loose on shaft, or inlet plugged</li> <li>Pump may be air locked causing pump not to flow</li> <li>Piping fixtures leaking or discharge before the nozzle</li> </ol>	and inlet of any obstruction  9. Loosen union slightly to allow trapped air to
Pump cycles too frequently or runs periodically when fixtures are not in use	Check valve partially closed or installed backwards     T1. Fixtures are leaking     Scround water entering basin	escape. Verify that turn-off level of switch is set so that the suction is always flooded. Clean vent hole 10. Check rotation. If power supply is three phase,
Pump shuts off and turns on independent of switch, (trips thermal overload protector).  CAUTION! Pump may start unexpectedly.  Disconnect power supply.	Incorrect low voltage     Excessive inflow or pump not properly sized for application     Impeller jammed or loose on shaft, or inlet plugged     Excessive water temperature (internal protection only)	reverse any two of three power supply leads to ensure proper impeller rotation  11. Repair fixtures as required to eliminate leakage  12. Check pump temperature limits and fluid temperature  13. Replace portion of discharge pipe with flexible connector or tighten existing piping.
Pump operates noisily or vibrates excessively	2c. Worn bearings, motor shaft bent     Debris in impeller cavity or broken impeller     10. Pump running backwards     13. Piping attachments to building structure too loose or rigid	14. Turn to automatic position 15. Check for leaks around basin inlet and outlets

**NOTE:** Barmesa Pumps assumes no responsibility for damage or injury due to disassembly in the field. Disassembly of the pumps or supplied accessories other than at Barmesa Pumps or its authorized service centers, automatically voids warranty.

## BARMESA PUMPS FACTORY WARRANTY

Barmesa Pumps warrants that products of our manufacture will be free of defects in material and workmanship under normal use and service for 18 months from date of manufacture or 12 months from installation date whichever occurs first. This warranty gives you specific legal rights, which vary from state to state.

This warranty is a limited warranty, and no warranty related claims of any nature whatsoever shall be made against Barmesa Pumps, until the ultimate consumer or his/her successor notifies us in writing of the defect and delivers the product and/or defective part(s) freight prepaid to our factory or nearest authorized service station as instructed by Barmesa Pumps. THERE SHALL BE NO FURTHER LIABILITY, WHETHER BASED ON WARRANTY, NEGLIGENCE OR OTHERWISE. PRODUCT SHALL BE EITHER REPLACED OR REPAIRED AT THE ELECTION OF BARMESA PUMPS. Guarantees relating to performance specifications provided in addition to the foregoing material and workmanship warranties on a product manufactured by Barmesa Pumps, if any, are subject to possible factory testing. Any additional guarantees, in the nature of certified performance specifications or time frame must be in writing and such writing must be signed by our authorized factory manager at time of order placement and/or at time of quotation. Due to inaccuracies in field testing and should a conflict arises between the results of field testing conducted by or for the user, Barmesa Pumps reserves the right to have the product returned to our factory for additional testing.

This warranty shall not apply when damage is caused by (1) improper installation, (2) improper voltage, (3) lightning, (4) excessive sand or other abrasive material, (5) corrosion build-up due to excessive chemical content or (6) uncontrollable acts of god. Any modification of the original equipment will also void the warranty. We will not be responsible for loss, damage or labor cost due to interruption of service caused by defective pumps, parts or systems. Barmesa Pumps will not accept charges incurred by others without our prior written approval.

This warranty is void if our inspection reveals the product was used in a manner inconsistent with normal industry practice and/or our specific recommendations. The purchaser is responsible for communication of all necessary information regarding the application and use of the product. UNDER NO CIRCUMSTANCES WILL WE BE RESPONSIBLE FOR ANY OTHER DIRECT OR CONSEQUENTIAL DAMAGES, INCLUDING BUT NOT LIMITED TO TRAVEL EXPENSES, CONTRACTOR FEES, UNAUTHORIZED REPAIR SHOP EXPENSES, LOST PROFITS, LOST INCOME, LABOR CHARGES, DELAYS IN PRODUCTION, IDLE PRODUCTION, WHICH DAMAGES ARE CAUSED BY ANY DEFECTS IN MATERIAL AND/OR WORKMANSHIP AND/OR DAMAGE OR DELAYS IN SHIPMENT. THIS WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER EXPRESS OR IMPLIED WARRANTY. No rights extended under this warranty shall be assigned to any other person, whether by operation of law or otherwise, without our prior written approval.
